

Kaska Exposure Management Platform™ — Product Datasheet

An Autonomous Cyber Risk & Resilience Platform — Continuous Exposure Intelligence · Control Validation · Risk-Driven Remediation

Designed for: Enterprise CISOs and security teams · BFSI · Government & Defence · Critical Infrastructure · MSSPs

Kaska Technologies & Services Pvt. Ltd.

1. Executive Overview

Product architecture: Exposure Management is Kaska's market entry category; Autonomous Cyber Risk & Resilience is the broader platform vision.

Kaska helps security teams answer five operational questions:

- 1 What **assets**, identities, applications, cloud resources and external **exposures** do we actually have?
- 1 Which security controls are deployed, configured and demonstrably enforced?
- 1 Which exposures and **attack paths** matter most to critical business services?
- 1 What is the potential business and financial impact of the highest-priority risks?
- 1 What action should be taken, what **evidence** supports it, and has the risk actually reduced?

Positioning — Kaska is not a replacement for SIEM, EDR, IAM, PAM, firewalls, vulnerability management, cloud security or GRC. It is an intelligence and action layer above the existing security stack.

The Kaska Value Proposition

From	To
Tool-by-tool visibility	One asset-centric exposure model
Configuration assumed to be effective	Continuous control-state validation
Flat vulnerability queues	Exposure and attack-path prioritisation
Technical severity only	Business and financial risk context
Periodic evidence collection	Continuously maintained evidence
Manual cross-tool response	Governed, policy-controlled orchestration

2. How Kaska Works

Kaska uses a common operating model across exposure management, **control validation**, risk analysis, compliance evidence and remediation.

Step	What Kaska Does	Output
1. Discover	Ingests asset, identity, cloud, external exposure, vulnerability and security-tool data; deduplicates and classifies entities.	Unified asset and exposure inventory
2. Validate	Reads configuration and policy state from supported security controls; distinguishes observed state from unavailable evidence.	Control posture + evidence
3. Prioritise	Correlates exposures, vulnerabilities, identities, dependencies and attack paths; adds asset criticality and business context.	Ranked risk and remediation queue
4. Act	Creates cases and executes approved workflows across connected tools. Autonomy can be configured by action and risk tier.	Governed remediation
5. Verify	Re-checks the relevant control/exposure state and updates risk and evidence.	Closed-loop assurance

Core Capabilities

Capability	What It Means
Asset & Exposure Intelligence	Discover and classify internal, cloud and internet-facing assets; maintain a de-duplicated asset graph; associate vulnerabilities, identities, controls and business criticality.
Continuous Control Validation	Validate selected control configurations through direct integrations where configuration-state evidence is required; report controls as not assessed when required evidence is unavailable.
Exposure & Attack-Path Analysis	Connect vulnerabilities, misconfigurations, identity relationships and network paths to show how exposure can reach critical assets.
Business & Financial Risk	Translate technical exposure into business impact and, where configured, FAIR -aligned financial risk measures such as ALE and VaR.
Compliance & Evidence	Map validated findings and evidence to supported frameworks and produce reusable, traceable evidence packages.
AI-Assisted Investigation & Response	Correlate signals, enrich incidents with asset context and execute approved response playbooks across connected tools.
AI Estate Governance	Extend the same asset-and-control model to selected AI systems, copilots and agents, with mappings to relevant AI security and governance references.

3. Exposure Management Across the Security Stack

Kaska is designed to complement the customer's existing investments. The platform combines event data with configuration-state data because exposure management requires both what is happening and what controls are actually configured to do.

Security Domain	Representative Inputs	Kaska Outcome
Identity & Access	Entra ID / Active Directory, Okta, SailPoint, Saviynt, Ping, Google Workspace	MFA and access posture, privileged-account exposure, stale identities, policy gaps
Endpoint & Device	CrowdStrike, Microsoft Defender, SentinelOne, Trend Micro, Cortex XDR, NAC	Coverage, prevention posture, sensor health, device-control gaps
Network	NGFW, VPN, NAC, ZTNA/CASB, network infrastructure	Segmentation and access-control exposure, risky rules and paths
Cloud	AWS, Azure, GCP security/configuration services	Cloud resource inventory, identity and configuration exposure
Vulnerability & Exposure	Tenable, Qualys, Rapid7, EASM, attack-simulation outputs	Contextualised vulnerabilities, exploitable paths, validation discrepancies
Data & Recovery	DLP/DSPM, backup platforms, encryption/key management	Data-protection and recovery-control posture
Security Operations	SIEM, XDR, SOAR, UEBA, threat intelligence	Correlated incident context and response triggers
Assurance & GRC	VAPT, audit findings, GRC platforms	Evidence-backed findings and remediation tracking
OT/ICS	OT security platforms and assurance data	OT asset/control posture and security findings

Integration Principle

Use aggregated event sources where they already exist; use direct APIs where Kaska must inspect configuration or policy state. Connector availability varies by release and deployment model.

Vendor-Agnostic by Design

Kaska is intended to remain useful when customers add, replace or consolidate security tools. The platform's asset and risk model is independent of any single underlying vendor.

4. Deployment & Security Model

Deployment	Typical Use	Key Characteristics
SaaS	Enterprise and service-provider customers	Fast deployment; managed platform; annual subscription; integrations configured by customer
MSSP Multi-Tenant	Managed security service providers	Tenant isolation; central policy/reporting; white-label/service-provider operating model
Private Cloud	Regulated enterprises	Dedicated instance in customer-selected cloud region; data residency controls
On-Premise	Government, PSU, critical infrastructure	Customer-hosted deployment; supports environments with restricted external connectivity
Air-Gapped	Defence / highly restricted environments	No outbound connectivity; local AI/runtime options; offline update and threat-intelligence procedures as designed

Platform Security

- 1 Tenant-scoped data access and role-based access controls.
- 1 Encrypted integration credentials and scoped connector permissions.
- 1 HTTPS and API authentication with rate limiting and input validation.
- 1 Structured audit logging for authentication, data access and orchestration activity.
- 1 Configurable autonomy levels with approval gates for higher-impact actions.
- 1 Optional immutable/WORM evidence storage where supported by the deployment architecture.

Current Release Snapshot

The current engineering snapshot described in the technical whitepaper includes 41 application services, 18 AI/analytics engines, approximately 1,399 executed control checks across 31 domains, 225 connectors across 39 categories, mappings to 17 frameworks, and approximately 7,300 automated tests. These figures should be versioned and refreshed with each product release.

Important — Product capabilities, connector counts, framework mappings and deployment features are release-dependent. Confirm the applicable feature matrix for a specific customer opportunity.

5. Business Outcomes

Outcome	How Kaska Supports It
Reduce exposure	Identify and prioritise exposures by asset criticality, exploitability, control posture and business context.
Focus remediation	Move from large vulnerability/configuration queues to a smaller set of high-impact exposure paths and control gaps.
Increase control assurance	Provide evidence of observed control state rather than relying only on deployment or policy attestations.
Improve incident readiness	Assemble asset, identity, exposure and business context around incidents and support governed response.
Reduce compliance effort	Reuse continuously collected evidence across supported framework mappings; reduce duplicate evidence gathering.
Protect existing investments	Integrate with existing security tooling rather than requiring rip-and-replace.
Support executive decisions	Present exposure, business impact and financial risk in a form suitable for CISO, risk committee and board discussions.

A Simple Executive Question

Executive lens — Kaska helps leadership move from "How many findings do we have?" to "Which exposures matter, what controls are failing, what is the business impact, and what should we do next?"

Kaska Technologies & Services Pvt. Ltd. | Product capabilities, connector availability, framework mappings and deployment features are release-dependent and should be confirmed for each deployment.
